# Motivation

1. Quantum-dot cellular automata (QCA) is a new nanotechnology for the implementation of nano-sized digital circuits.
2. This nanotechnology is remarkable in terms of speed, area, and power consumption compared to complementary metal-oxide-semiconductor (CMOS) technology and can significantly improve the design of various logic circuits.
3. Latches and counters are blocks which used mainly in arithmetic logic unit (ALU). Therefore, designing these circuits in QCA technology is of high importance.

Front Inform Technol Electron Eng

# Main idea

1. We propose a new method for implementing a T-latch in QCA technology.
2. The proposed method uses the intrinsic features of QCA in timing and clock phases, and therefore, the proposed cell structure is less occupied and less power-consuming than existing implementation methods.
3. Also, new T-latch with set/reset terminals is proposed.
4. In addition, new counters are designed in QCA nanotechnology.

Front Inform Technol Electron Eng

# Method

1. We propose a new method for implementing a T-latch in QCA technology.
2. The proposed method uses the intrinsic features of QCA in timing and clock phases, and therefore, the proposed cell structure is less occupied and less power-consuming than existing implementation methods.
3. In the proposed T-latch, compared to previous best designs, reductions of 6.45% in area occupation and 44.49% in power consumption were achieved.

# Method (Cont'd)

4. A reset-based T-latch and a T-latch with set and reset capabilities are also designed.
5. Using the proposed T-latch, a new 3-bit counter is developed which reduces 2.14% of cell numbers compared with the best of previous designs.
6. Moreover, based on the 3-bit counter, a 4-bit counter is designed, which reduces 0.51% cell numbers and 4.16% cross-section area compared to previous designs.
7. In addition, two selective counters are introduced to count from 0 to 5 and from 2 to 5.

# Conclusions

1. In this research, we have discussed the principles of quantum cell design. Also, simple and useful designs of T-latches, T-latches with reset input, and T-latches with set and reset inputs have been presented.
2. In addition, a level-to-edge converter has been used for clock of T-latches which leads to TFF topologies.
3. We have also designed, with the help of the suggested flip-flops, a 3-bit counter, a 4-bit counter, a 0–5 selective counter, and a 2–5 intermediate selective counter.

**Mohammad GHOLAMI** was born in Babol, Iran in 1986. He received the BSc degree in Electronic Engineering from University of Mazandaran (Babol Noshirvani University of Technology), Babol, Iran in 2008. He also received the MSc degree in Micro Electronic field from Sharif University of Technology, Tehran, Iran in 2010 and PhD degree from Babol Noshirvani University of Technology in 2014. From 2015, he has been a member of the Faculty of Engineering and Technology at University of Mazandaran. His current research interests include the analysis design of radio frequency CMOS integrated circuits and systems, mixed signal circuit design, digital and analog circuit design and also digital design by emerging technologies, mainly on quantum-dot cellular automata (QCA).

**Zaman AMIRZADEH** was born in Babol, Iran in 1992. He received the BS degree in Electrical and Electronic Engineering from Aryan Institute of Science and Technology, Babol, Iran, in 2015, and he completed the MSc degree in Electronic from Mazandaran University of Science and Technology, Babol, Iran, in 2018. His current research interests include VLSI, low power strategies, design in emerging technology mainly on quantum-dot cellular automata (QCA) and digital systems design
