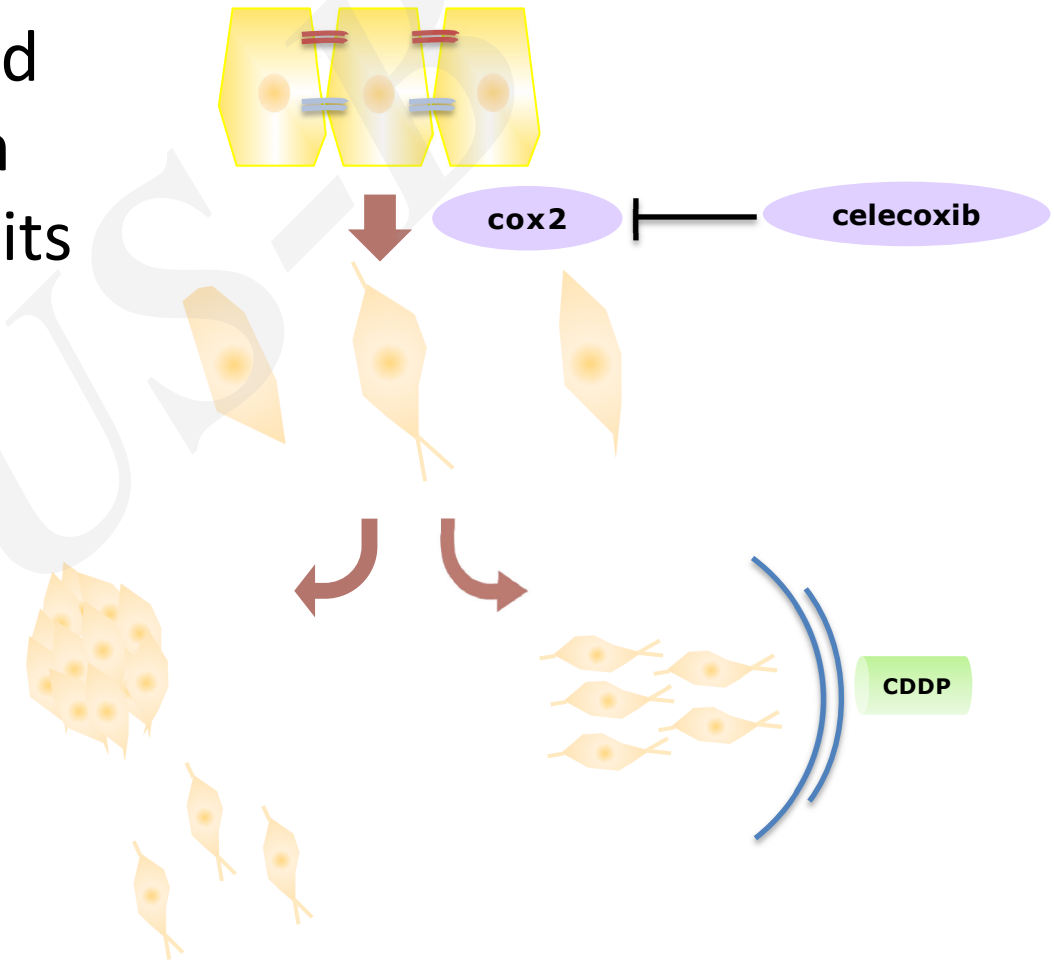
Cyclooxygenase 2 promotes ovarian cancer cells migration and cisplatin resistance via regulating epithelial mesenchymal transition

Key words: Ovarian cancer, Cox2, Drug resistance, Migration, EMT

Cyclooxygenase 2 promotes ovarian cancer cells migration and cisplatin resistance via regulating epithelial mesenchymal transition. *Journal of Zhejiang University-Science B (Biomedicine & Biotechnology)*, **21**(4):315-326. http://dx.doi.org/10.1631/jzus.B1900445

Research Summary

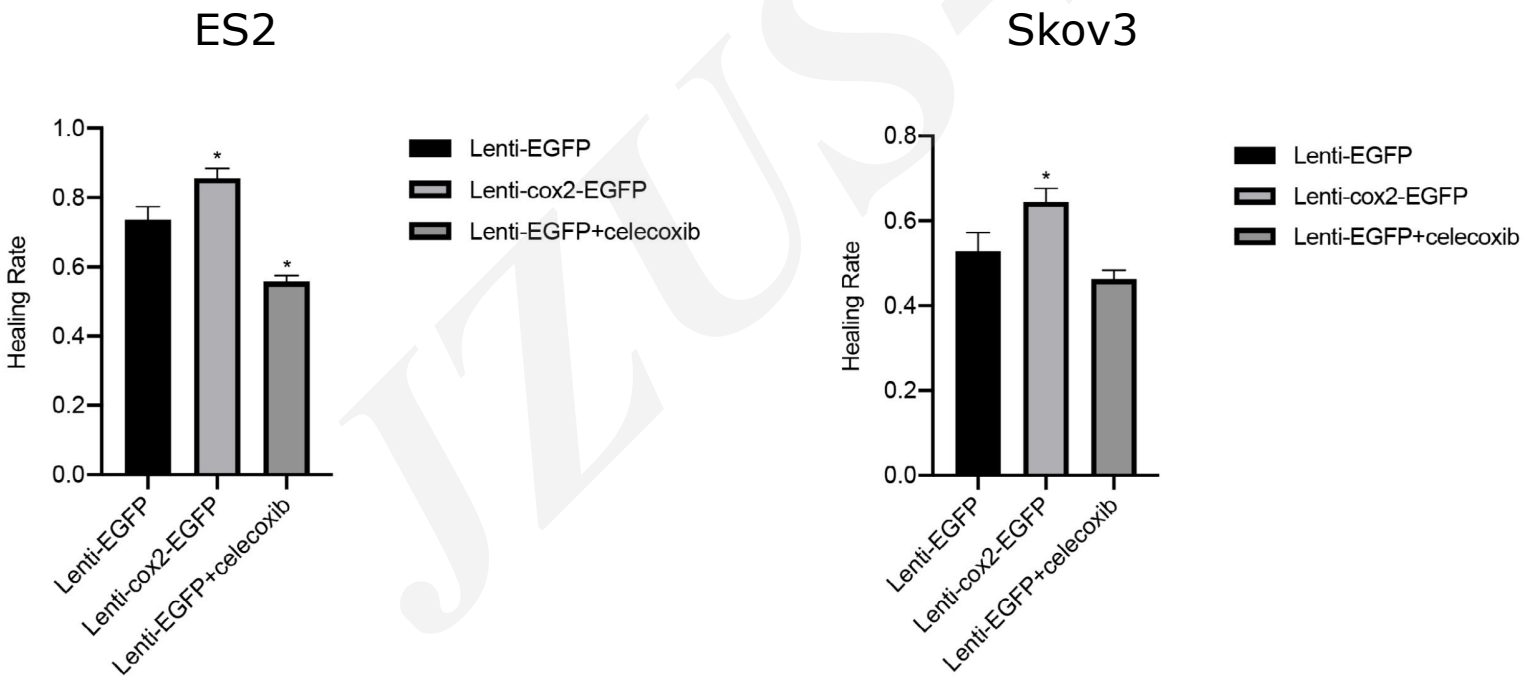
This study mainly focused on the effects of cox2 on ovarian cancer cells and its mechanism:



- *Promote cells migration*
- *Accelerate cells cisplatin resistance*
- *Regulate EMT pathway*

Innovation Points

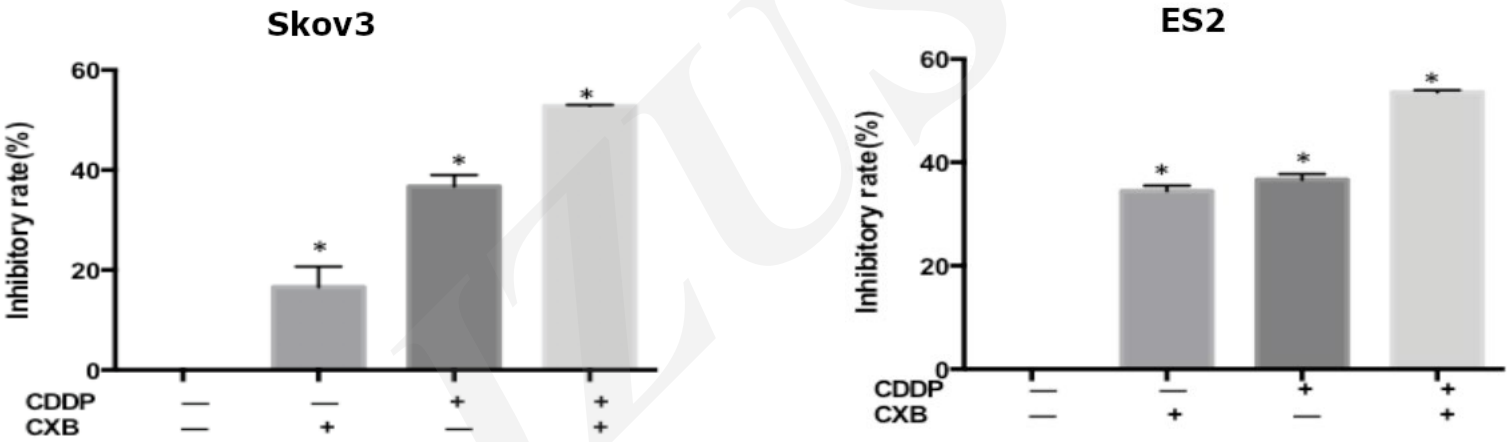
- ***Effects of cox2 and celecoxib on migration***



JZUS-B

Innovation Points

- ***Celecoxib inhibits cells resistance to CDDP, and even, partially reverse this effect***



Innovation Points

- ***Cox2 regulates cells via EMT***
