Synchronization of nonlinear multi-agent systems using a non-fragile sampled data control approach and its application to circuit systems

Key words: Multi-agent systems (MASs); Non-fragile sampled data control (NFSDC); Time-varying delay; Linear matrix inequality (LMI); Asymptotic synchronization

MOTIVATION

- Non-fragile control can adjust gain fluctuation in the design of the controller and is used to assure system stability when small disruptions occur in the design of the controller. A few noteworthy works on the non-fragile control problem in multi-agent systems (MASs) have been published.

- To a greater extent, the conditions for achieving asymptotic synchronization of nonlinear MASs with non-fragile sampled data control (NFSDC) have not been comprehensively addressed, which serves as a motivation for the investigation in this paper.

Front Inform Technol Electron Eng

MAIN IDEA

- In practical applications, neural network (NN) based circuit systems are modeled as MAS-based leader and follower systems for analyzing the synchronization issue, which is based on Lyapunov-Krasovskii functional with Kronecker product.
- For MASs, NFSDC is designed, and then sufficient conditions of synchronization criteria are derived using Lemma 1. The derived conditions assure the asymptotic stability of the MAS error system.
- The generality of our strategy in designing a controller distinguishes it from the past work in this area of research. Furthermore, it provides a broad framework for investigating synchronization difficulties that are related to the consistency of control strength over time, such as NFSDC.
- The approaches in Ma et al. (2016) have been compared to confirm the efficacy of the suggested method in the numerical simulation.

Front Inform Technol Electron Eng

MAIN IDEA

Lemma 1 (Seuret and Gouaisbaut, 2013) For a given matrix $\bar{Q} > 0$, the following inequality holds for $\omega : [c, d] \to \mathbb{R}^n$:

$$-\int_c^d \dot{\omega}^{\mathrm{T}}(\varsigma)\bar{Q}\dot{\omega}(\varsigma)\mathrm{d}\varsigma \leq -\frac{1}{d-c}(\omega(d)-\omega(c))^{\mathrm{T}}\bar{Q} \cdot (\omega(d)-\omega(c)) - \frac{3}{d-c}\Pi^{\mathrm{T}}\bar{Q}\Pi,$$

where $\Pi = \omega(d) + \omega(c) - \frac{2}{d-c}\int_c^d \omega(\varsigma)\mathrm{d}\varsigma$.

METHOD

- A widespread synchronization for chaotic NNs was given, and numerous suitable conditions were found by employing a suitable Lyapunov-Krosovskii functional.

- The time-step sampled data from agent *i* are encapsulated in a packet of data, subsequently transferred to its controller and agent *j* over agent *i*'s communication network. Zero-order hold (ZOH) is used to update the input and output actuators of controller *i*. ZOH represents the outcome of keeping each sample value for one sample interval while converting a discrete-time signal to a continuous-time one.

- Here, cooperative synchronization implies that the two dynamic systems with the leader and followers will attain the same partial state. Generally, the leader uses channels to broadcast a communication signal that triggers the followers, and this signal induces the coordination between the leader and followers.

CONCLUSIONS

- In this work, the MAS synchronization problem has been investigated using a non-fragile sampled data control (NFSDC) scheme. The suitable Lyapunov-Krosovskii functional has been constructed to derive the synchronization criteria for the proposed MASs, expressed in linear matrix inequality (LMI) forms.
- The proposed control scheme has achieved synchronization between the leader and follower systems with the derived sufficient conditions.
- Numerical validation has demonstrated the effectiveness of the presented method. As a future work topic, it will be exciting to explore the possibility of extending the NFSDC scheme to event-triggered control when unanticipated disruptions occur in MASs.

Stephen AROCKIA SAMY received his BS degree in mathematics from Ananda College affiliated to Alagappa University, Karaikudi in 2014, his MS and PhD degrees in Alagappa University, Karaikudi, Tamilnadu, India, in 2016 and 2017, respectively. Presently, he is working as an assistant professor in Chennai Institute of Technology, Chennai, India. His current research interests include stability and synchronization theory of multi-agent systems, T-S fuzzy systems, complex systems, suspension systems, and impulsive dynamical systems and its applications.

Front Inform Technol Electron Eng

Dr. Raja RAMACHANDRAN received his MS, M.Phil., and PhD degrees in mathematics from Periyar University, Salem, India, in 2005, 2006, and 2011, respectively. He served as a guest faculty at Periyar University, India, after the completion of his doctoral studies. He is currently working as an assistant professor in Ramanujan Centre for Higher Mathematics, Alagappa University, Karaikudi, India. He was the recipient of the Sir.C.V. Raman Budding Innovator Award for 2010 from Periyar University, India. Recently he has received the “365 Years of Fractional Calculus Award” from Brunei University, Turkey. His research interests include fractional differential equations, neural networks, genetic regulatory networks, robust nonlinear control, stochastic systems, stability analysis of dynamical systems, and synchronization and chaos theory.

Dr. Pratap ANBALAGAN received his BS degree in mathematics from Hajee Karutha Rowther Howdia College affiliated to Madurai Kamraj University, Madurai in 2013, his MS and M.Phil degrees in mathematics from Alagappa University, Karaikudi, Tamilnadu, India, in 2015 and 2016, respectively. Presently, he is working as a postdoctoral researcher in Kunsan National University, Republic of Korea. He was a recipient of the University Rank Holder Award with gold medal in M. Phil. He also received the most prestigious “Oliviu Gherman Award” in testimony of the High Reward of the Achievements in the Area of Fractional Calculus and its Applications by Biruni University, Turkey. His current research interests include stability theory of neural networks, fractional-order synchronization neural networks, memristor-based neural networks, complex systems, and stochastic and impulsive dynamical systems.
