Motivation

Although a lot of papers have been published for input delay, it is worth mentioning that most research is mainly in the field of nonsingular fractional-order systems with input delay. For general singular systems with input delay, these were rarely studied. In short, the contributions are as follows:

1. Using the Smith predictor, observer-based control is first studied for fractional-order singular systems with order α ($0<\alpha<1$) and input delay.
2. The necessary and sufficient condition based on nonstrict LMI is presented. Then, the condition based on strict LMI is improved.

Front Inform Technol Electron Eng

System model

For the following fractional-order singular system (1), define the state transformation (2)

$$\begin{cases} E\mathrm{D}^{\alpha}x(t) = Ax(t) + B_1u(t) + B_2u(t-\tau), \\ y(t) = Cx(t), \end{cases} \tag{1}$$

$$Ez(t) = Ex(t) + \int_{t-\tau}^{t} e_{\alpha}^{A(t-s-\tau)}B_2u(s)\mathrm{d}s. \tag{2}$$

Using the properties of fractional calculus, we obtain

$$\bar{E}\mathrm{D}^{\alpha}\bar{z}(t) = \bar{A}\bar{z}(t), \tag{9}$$

$$\begin{cases} \bar{E} = \begin{bmatrix} E & 0 \\ 0 & E \end{bmatrix}, \ \bar{z}(t) = \begin{bmatrix} z(t) \\ z(t) - \hat{z}(t) \end{bmatrix}, \\ \bar{A} = \begin{bmatrix} A + \bar{B}K & -\bar{B}K \\ 0 & A - LC \end{bmatrix}. \end{cases} \tag{10}$$

Front Inform Technol Electron Eng

Main lemma

Lemma 1 (Zhang XF and Chen, 2018) The fractional-order linear singular system $\boldsymbol{E}\mathrm{D}^{\alpha}\boldsymbol{x}(t)=\boldsymbol{A}\boldsymbol{x}(t)$ with $\mathrm{rank}(\boldsymbol{E})<n$ is asymptotically admissible if and only if the following inequalities hold with two matrices $\boldsymbol{X}$ and $\boldsymbol{Y}$:

$$\begin{bmatrix} \boldsymbol{E}\boldsymbol{X} & \boldsymbol{E}\boldsymbol{Y} \\ -\boldsymbol{E}\boldsymbol{Y} & \boldsymbol{E}\boldsymbol{X} \end{bmatrix} = \begin{bmatrix} \boldsymbol{X}^{\mathrm{T}}\boldsymbol{E}^{\mathrm{T}} & -\boldsymbol{Y}^{\mathrm{T}}\boldsymbol{E}^{\mathrm{T}} \\ \boldsymbol{Y}^{\mathrm{T}}\boldsymbol{E}^{\mathrm{T}} & \boldsymbol{X}^{\mathrm{T}}\boldsymbol{E}^{\mathrm{T}} \end{bmatrix} \geq 0,$$

$$a\boldsymbol{A}\boldsymbol{X} + a\boldsymbol{X}\boldsymbol{A}^{\mathrm{T}} + b\boldsymbol{A}\boldsymbol{Y} - b\boldsymbol{Y}\boldsymbol{A}^{\mathrm{T}} < 0,$$

where $a=\sin(\alpha\pi/2)$ and $b=\cos(\alpha\pi/2)$.

Front Inform Technol Electron Eng

Main results

Theorem 1 System (9) with matrices $\boldsymbol{K}$ and $\boldsymbol{L}$ is asymptotically admissible, if and only if there exist matrices $\boldsymbol{X}_1$, $\boldsymbol{X}_2$, $\boldsymbol{Y}_1$, $\boldsymbol{Y}_2$, $\boldsymbol{Z}$, and $\boldsymbol{R}$ such that the following inequalities hold:

$$\begin{bmatrix} \boldsymbol{E}\boldsymbol{X}_1 & \boldsymbol{E}\boldsymbol{Y}_1 \\ -\boldsymbol{E}\boldsymbol{Y}_1 & \boldsymbol{E}\boldsymbol{X}_1 \end{bmatrix} = \begin{bmatrix} \boldsymbol{X}_1^{\mathrm{T}}\boldsymbol{E}^{\mathrm{T}} & -\boldsymbol{Y}_1^{\mathrm{T}}\boldsymbol{E}^{\mathrm{T}} \\ \boldsymbol{Y}_1^{\mathrm{T}}\boldsymbol{E}^{\mathrm{T}} & \boldsymbol{X}_1^{\mathrm{T}}\boldsymbol{E}^{\mathrm{T}} \end{bmatrix} \geq 0, \quad (11)$$

$$\begin{bmatrix} \boldsymbol{E}\boldsymbol{X}_2 & \boldsymbol{E}\boldsymbol{Y}_2 \\ -\boldsymbol{E}\boldsymbol{Y}_2 & \boldsymbol{E}\boldsymbol{X}_2 \end{bmatrix} = \begin{bmatrix} \boldsymbol{X}_2^{\mathrm{T}}\boldsymbol{E}^{\mathrm{T}} & -\boldsymbol{Y}_2^{\mathrm{T}}\boldsymbol{E}^{\mathrm{T}} \\ \boldsymbol{Y}_2^{\mathrm{T}}\boldsymbol{E}^{\mathrm{T}} & \boldsymbol{X}_2^{\mathrm{T}}\boldsymbol{E}^{\mathrm{T}} \end{bmatrix} \geq 0, \quad (12)$$

$$\boldsymbol{P}_1 = a\boldsymbol{X}_1 + b\boldsymbol{Y}_1, \ \mathrm{sym}(\boldsymbol{P}_1\boldsymbol{A} - \boldsymbol{Z}\boldsymbol{C}) < 0, \quad (13)$$

$$\boldsymbol{P}_2 = a\boldsymbol{X}_2 + b\boldsymbol{Y}_2, \ \mathrm{sym}(\boldsymbol{A}\boldsymbol{P}_2 + \bar{\boldsymbol{B}}\boldsymbol{R}) < 0, \quad (14)$$

where a=sin($\alpha\pi$/2) and b=cos($\alpha\pi$/2). Furthermore, $\boldsymbol{L}$ and $\boldsymbol{K}$ are given by

$$\boldsymbol{L} = \boldsymbol{P}_1^{-1}\boldsymbol{Z}, \ \boldsymbol{K} = \boldsymbol{R}\boldsymbol{P}_2^{-1}. \quad (15)$$

Main results (Cont'd)

Remark 1 Inequalities (11) and (12) are nonstrict LMIs, which contain equality constraints. Due to round-off errors in numerical calculations, equality constraints are fragile and usually cannot be well satisfied. As a result, the strict LMI-based condition is proposed in the following theorem.

Front Inform Technol Electron Eng

Main results (Cont'd)

Theorem 2 System (9) with matrices ***K*** and ***L*** is asymptotically admissible, if and only if there exist matrices $\boldsymbol{X}_1$, $\boldsymbol{X}_2$, $\boldsymbol{Y}_1$, $\boldsymbol{Y}_2$, $\boldsymbol{Q}$, $\boldsymbol{Z}$, and $\boldsymbol{R}$ such that the following inequalities hold:

$$\begin{bmatrix} \boldsymbol{X}_1 & \boldsymbol{Y}_1 \\ -\boldsymbol{Y}_1 & \boldsymbol{X}_1 \end{bmatrix} > 0, \tag{24}$$

$$\begin{bmatrix} \boldsymbol{X}_2 & \boldsymbol{Y}_2 \\ -\boldsymbol{Y}_2 & \boldsymbol{X}_2 \end{bmatrix} > 0, \tag{25}$$

$$P_1 = a\boldsymbol{X}_1 + b\boldsymbol{Y}_1,\ \mathrm{sym}(P_1\boldsymbol{E}^{\mathrm{T}}\boldsymbol{A} + \boldsymbol{S}\boldsymbol{Q}\boldsymbol{A} - \boldsymbol{Z}\boldsymbol{C}) < 0, \tag{26}$$

$$P_2 = a\boldsymbol{X}_2 + b\boldsymbol{Y}_2,\ \mathrm{sym}(\boldsymbol{A}P_2\boldsymbol{E}^{\mathrm{T}} + \boldsymbol{A}\boldsymbol{S}\boldsymbol{Q} + \bar{\boldsymbol{B}}\boldsymbol{R}) < 0, \tag{27}$$

where a=sin($\alpha\pi$/2), b=cos($\alpha\pi$/2), and ***S*** satisfies ***ES***=0. Furthermore, ***L*** and ***K*** are given by

$$L = P_1^{-1}Z,\ K = RP_2^{-1}. \tag{28}$$

Simulations

Example 1

System (9) with parameters as follows is considered:

$$E = \begin{bmatrix} 0 & -1 & 0 & -1 \\ 1 & 2 & 0 & 1 \\ -2 & -2 & 1 & -2 \\ -1 & -1 & 0 & 0 \end{bmatrix}, \quad A = \begin{bmatrix} 1 & -1 & -1 & 1 \\ 0 & 3 & 2 & 0 \\ 2 & -5 & -1 & -5 \\ 1 & -2 & -1 & -1 \end{bmatrix},$$

$$B_1 = \begin{bmatrix} 1 \\ 1 \\ 1 \\ 2 \end{bmatrix}, \quad B_2 = \begin{bmatrix} 1 \\ 1 \\ 0 \\ 1 \end{bmatrix},$$

$$C = [1 \quad 2 \quad 1 \quad -1], \ \alpha = \frac{1}{3}, \ \tau = 0.5.$$

Choose $S = \begin{bmatrix} -1 \\ 1 \\ -2 \\ -1 \end{bmatrix}$

Front Inform Technol Electron Eng

Then, solving inequalities (24)–(27) and Eq. (28) in Theorem 2, we can obtain the feasible solutions as follows:

$$K = [0.3225 \ -0.6320 \ -0.1244 \ 0.0123],$$

$$L = [-6.3313 \ -8.6988 \ 1.6989 \ -7.6680]^{\mathrm{T}}.$$

Conclusions

The paper deals with observer-based controller design for fractional-order singular systems with α ($0<\alpha<1$) and input delay. Using the linear matrix inequality (LMI) technique, the necessary and sufficient condition based on the nonstrict LMI is obtained. In the case of random error, the nonstrict LMI-based condition will cause trouble. When we improve the condition based on the strict LMI, the condition is easier to handle. Finally, the numerical example and the DC motor example are given to illustrate the effectiveness of the proposed condition.

In the future, observer-based robust control and observer-based H_∞ control for fractional-order singular systems will be studied.
