Breast metastasis of gastric signet-ring cell carcinoma

JZUS-B

Key words: Breast metastasis, Gastric signet-ring cell carcinoma, Extra-mammary neoplasm

Research Summary

This review mainly focused on metastatic breast involvement from gastric carcinoma. We have made a literature review of the diagnosis, treatment, and the prognosis of the disease. More researches about the mechanism and the clinical features of the metastasis disease should be done. In the future, with the application of circulating tumor cells and DNAs, a better understanding of the tumor heterogeneity may help improve the therapy.
