## **Packing and film thickness theories for the mix design of high-performance concrete**

Pui-Lam NG, Albert Kwok-Hung KWAN, Leo Gu LI

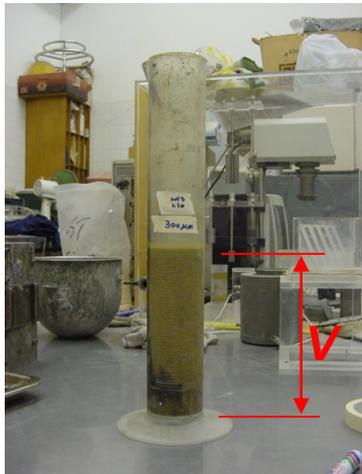

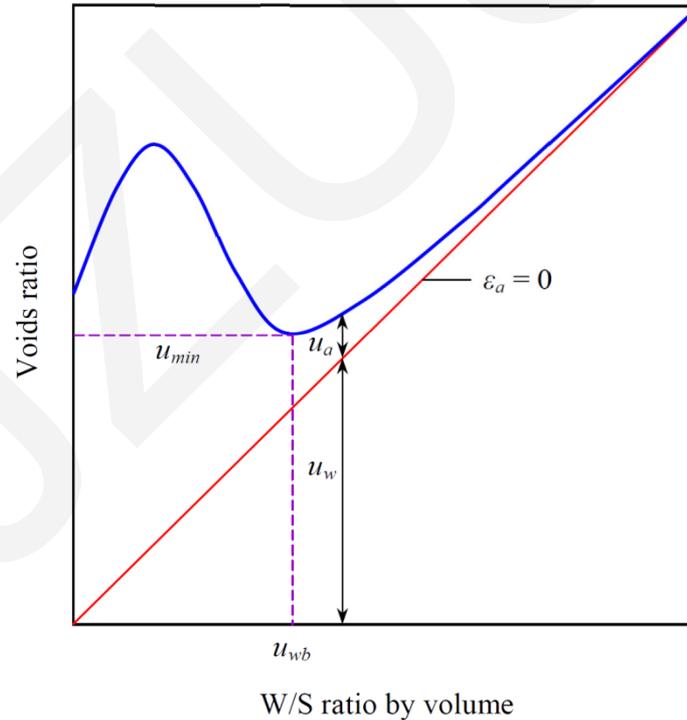

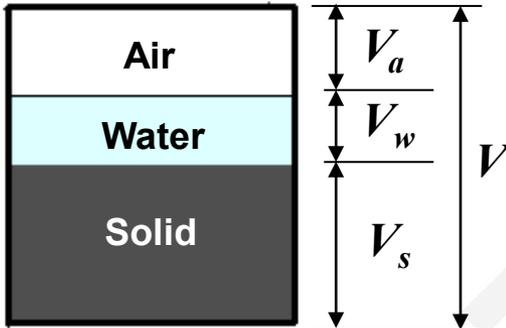

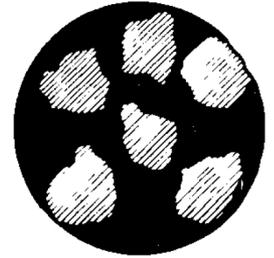

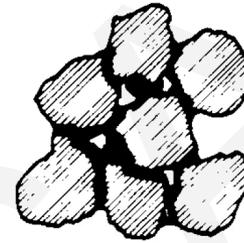

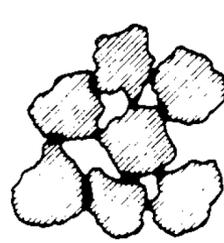

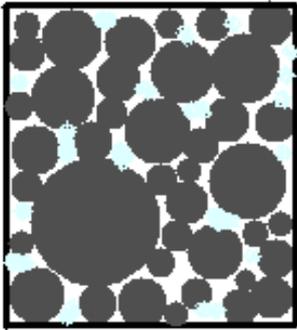

**Keywords:** Concrete mix design, concrete science, film thickness, high-performance concrete, packing density, sustainability

# Introduction

- The mix design of high-performance concrete (HPC) is complicated
- The packing density of solid particles has major effects on the performance of concrete, through its great effects on:
  - Water film thickness (WFT) coating the cementitious materials particles,
  - Paste film thickness (PFT) coating the fine aggregate particles, and
  - Mortar film thickness (MFT) coating the coarse aggregate particles

# Wet Packing Test

# Experimental Investigation

## ■ 32 trial concrete mixes

Material	Specific surface area (m <sup>2</sup> /m <sup>3</sup> )
OPC	$1.55 \times 10^6$
Fine aggregate	$5.12 \times 10^4$
Portion of fine aggregate > 75 μm in size (excluding the portion < 75 μm in size)	$1.03 \times 10^4$
Portion of fine aggregate > 1.2 mm in size (excluding the portion < 1.2 mm in size)	$2.04 \times 10^3$
10 mm coarse aggregate	642
20 mm coarse aggregate	398

Slump flow test

V-funnel test

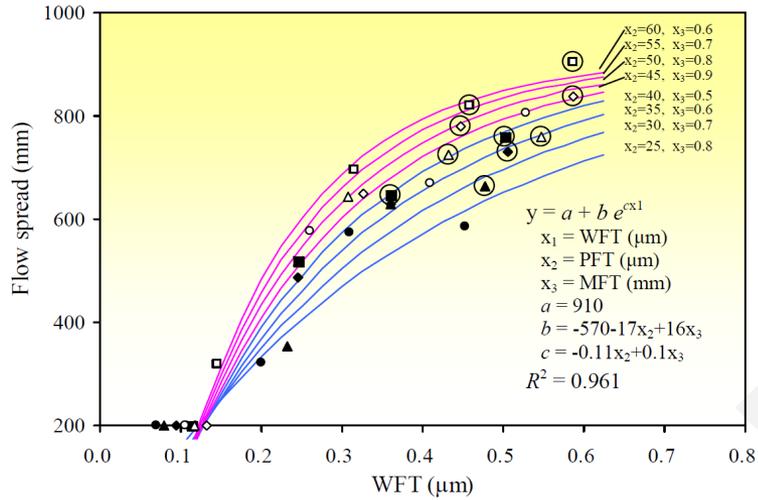

Sieve segregation test

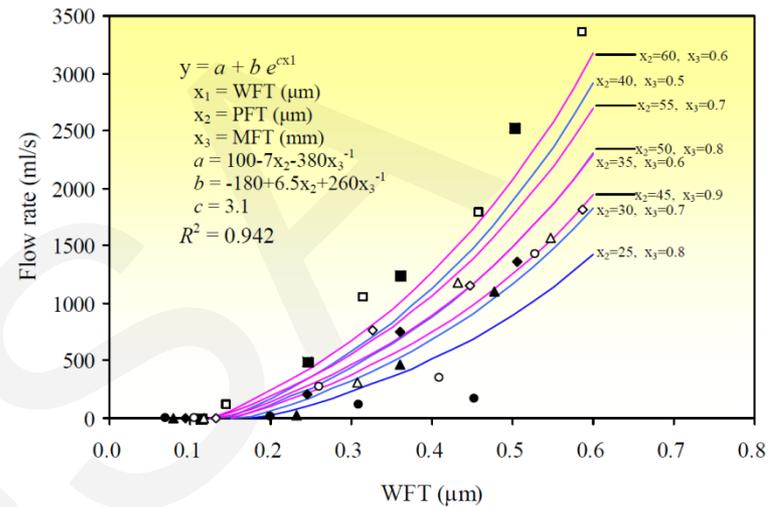

U-box test

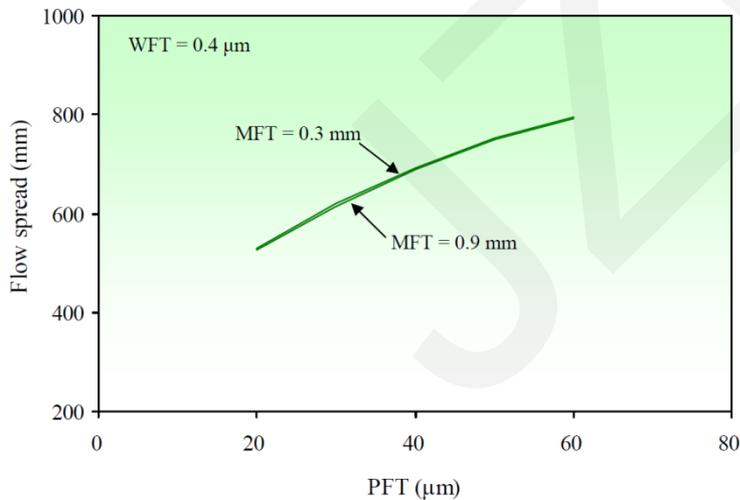

# Combined Effects of Film Thicknesses

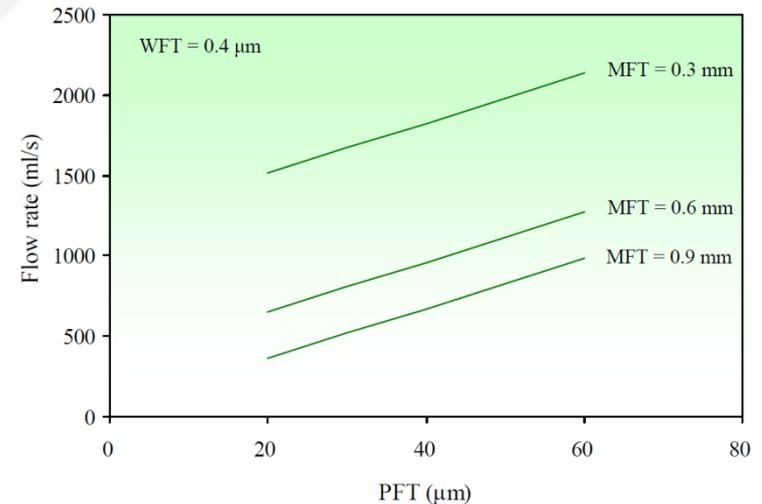

- PFT=26.5, MFT=0.79    ▲ PFT=30.2, MFT=0.73    ◆ PFT=34.3, MFT=0.56
- PFT=37.2, MFT=0.33    ○ PFT=41.4, MFT=0.92    △ PFT=47.5, MFT=0.87
- ◇ PFT=55.3, MFT=0.70    □ PFT=63.9, MFT=0.48    ○ Segregation

- PFT=26.5, MFT=0.79    ▲ PFT=30.2, MFT=0.73    ◆ PFT=34.3, MFT=0.56
- PFT=37.2, MFT=0.33    ○ PFT=41.4, MFT=0.92    △ PFT=47.5, MFT=0.87
- ◇ PFT=55.3, MFT=0.70    □ PFT=63.9, MFT=0.48

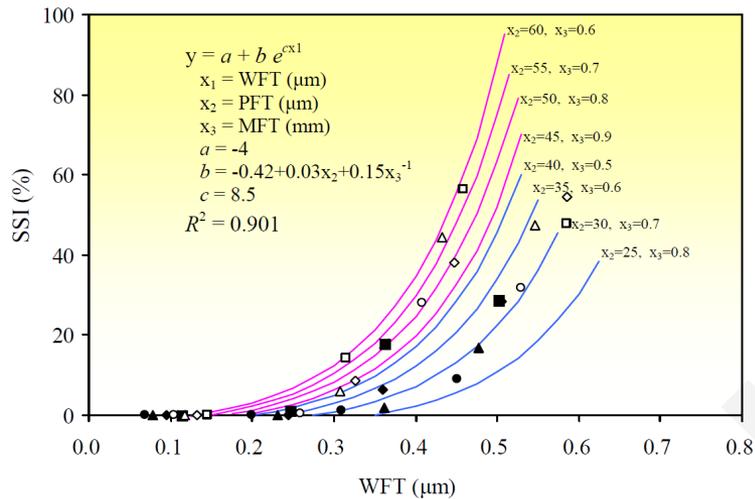

Effects on flow spread

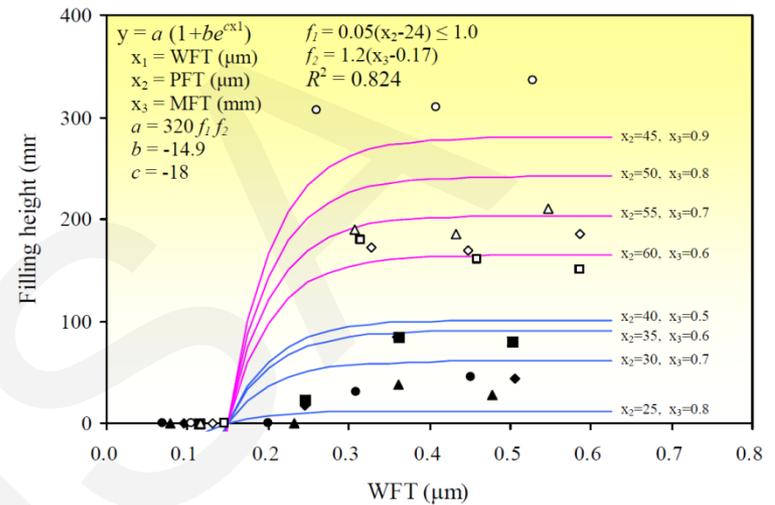

Effects on flow rate

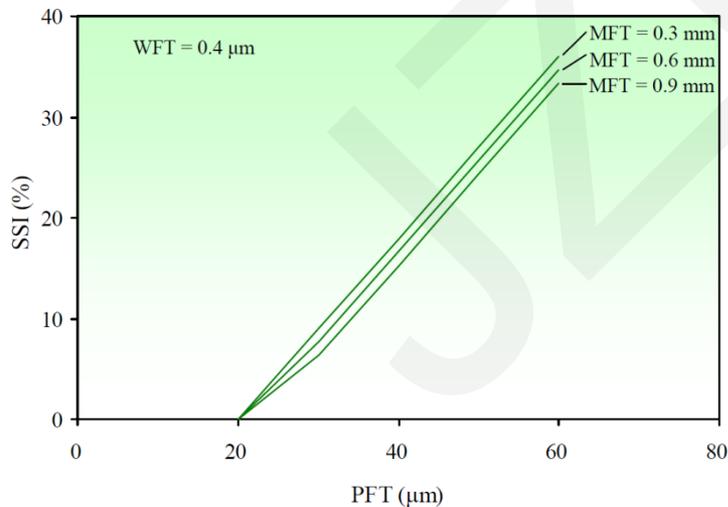

# Combined Effects of Film Thicknesses

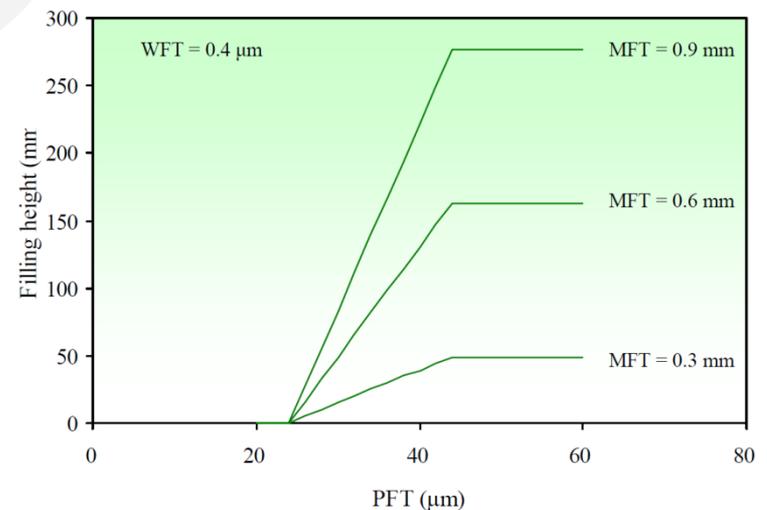

- PFT=26.5, MFT=0.79    ▲ PFT=30.2, MFT=0.73    ◆ PFT=34.3, MFT=0.56
- PFT=37.2, MFT=0.33    ○ PFT=41.4, MFT=0.92    △ PFT=47.5, MFT=0.87
- ◇ PFT=55.3, MFT=0.70    □ PFT=63.9, MFT=0.48

- PFT=26.5, MFT=0.79    ▲ PFT=30.2, MFT=0.73    ◆ PFT=34.3, MFT=0.56
- PFT=37.2, MFT=0.33    ○ PFT=41.4, MFT=0.92    △ PFT=47.5, MFT=0.87
- ◇ PFT=55.3, MFT=0.70    □ PFT=63.9, MFT=0.48

Effects on sieve segregation index

Effects on filling height

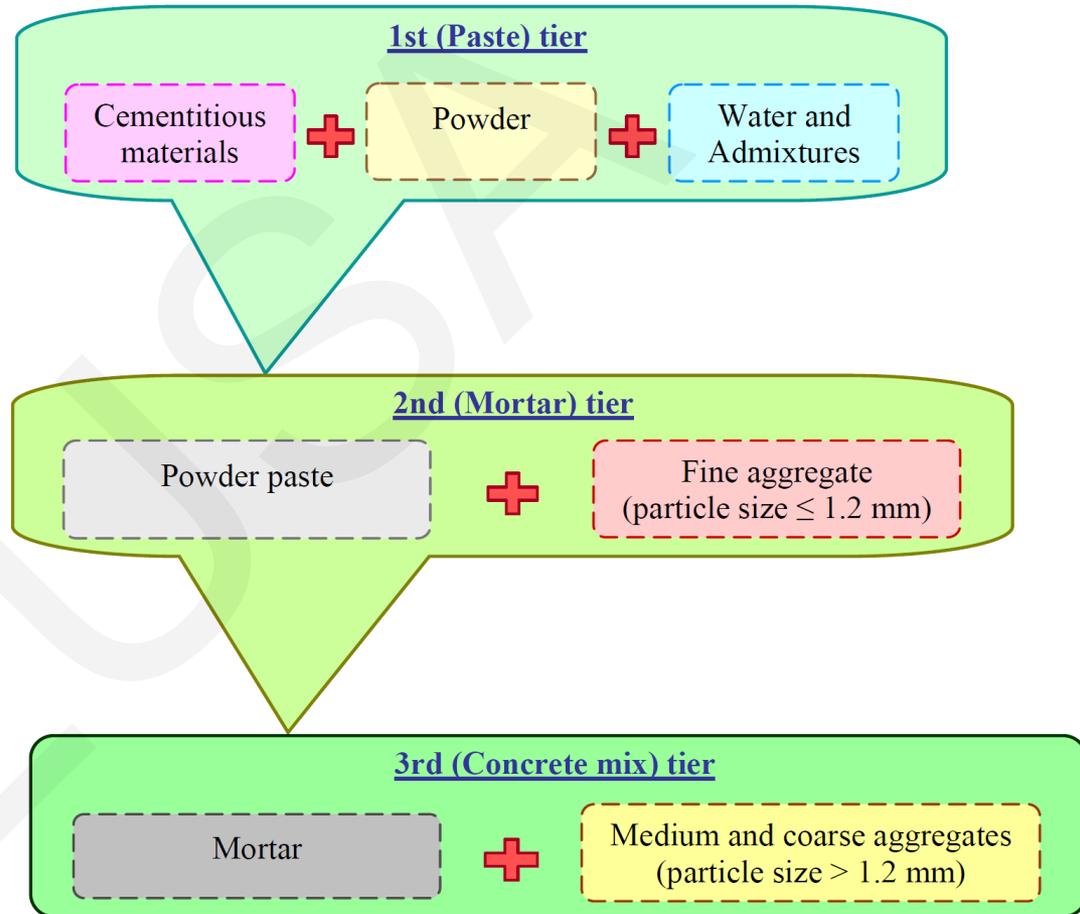

# Three-tier Mix Design Method

- Design the concrete mix in 3 tiers of increasing particle size range:

- First tier (paste tier): cementitious materials and powders ( $\leq 75 \mu\text{m}$  in size) which form the powder paste when mixed with water,

- Second tier (mortar tier): fine aggregate particles ( $\leq 1.2 \text{ mm}$  &  $> 75 \mu\text{m}$  in size) which form the mortar when mixed with the powder paste,

- Third tier (concrete mix tier): medium aggregate particles ( $\leq 5 \text{ mm}$  &  $> 1.2 \text{ mm}$  in size) and coarse aggregate particles ( $> 5 \text{ mm}$  in size) which form the concrete when mixed with the mortar

# Conclusions

---

- The packing and film thickness theories for the mix design of HPC have been presented
- For accurate measurement of packing density of concrete materials, the wet packing test had been developed
- The WFT, PFT and MFT are governing factors of the rheological performance of concrete
- To illustrate the above, a series of concrete mixes with different combinations of water/cement (W/C) ratio, cement paste volume (CPV) and fine/total aggregate (F/T) ratio were tested for their flowability, cohesiveness, passing ability and packing density
- The experimental results have revealed strong correlation of flow spread, flow rate, sieve segregation index (SSI) and U-box filling height with film thicknesses
- Redefinition of aggregate classifications is advocated by the authors
- Framework of the three-tier concrete mix design method has been developed
